Hewlet, 1630.

A new Almanacke and Prognostication, for the yeere of our Redemption, 1630:

Being the second after the Leape yeere, and from the worlds Creation 5592.

Composed for the Meridian of the ancient Towne or Borough of the Deuizes in Wilts, and may serue generally for all England without any great errour.

By *William Hewlet*, *Doctrinarum Studiosas.*

Viue memor quàm sis æuis breuis.

LONDON,

Printed for the Company of Stationers.

Common Notes and moueable Feasts for this present yeere of raGce. 1630. according to

The old account vsed in England.		The new Gregorian account vsed beyond the Seas.

The Anatomie of mans body, as the parts thereof are said to be gouerned by the 12. imaginary Signes of the Zodiacke.

♈ Aries, Head and face.

♉ Taurus. Necke and throat.

♋ Cancer. Brest, stomack & ribs.

♍ Virgo. Bowels and belly.

♏ Scorpio Secret mẽbers.

♑ Capricor. The knees.

♊ Gemini, Armes and shoulders.

♌ Leo. Heart and backe.

♎ Libra. Reines and ioynes.

♐ Sagitar. the Thighs.

♒ Aquar. The Legs.

♓ Pisces, The feete.

So many Veines in Man appeare
As there be dayes in a whole yeere:
His Bones two hundred seuenteene,
His Teeth thirty two, (as I deeme.)

Th'old yeere with ſoft and ſilent peace,
Is wheeld about: a new's begun.
Vſe well this preſent yeere of grace,
And truſt not to the time to come.

In fiue hundred fifty nine yeeres,
Twenty foure Princes (as appeares)
Haue raign'd and dyed, one after one,
Long liue King *Charles*, elſe we are vndone.

A Deſcription of the precedent Almanacke.

THys Almanacke is deuided into ſeuen Columnes. In the firſt, are the dayes of the moneth. In the ſecond, the dayes of the weeke. In the third, I haue placed the moueable feaſts, and other Saints dayes now vſed for holy dayes; the Termes of Law and their Returnes: and alſo the Saints dayes, becauſe many of them are yet in vſe in our Courts in England. And for many great Fayres, Markets and ancient cuſtomes kept on ſuch dayes, which are onely knowne by theſe names.

In the fourth Columne the ſigne and degrée, the Moone is in euery day at noone.

In the fifth the houre and minute of Sunriſing for moſt dayes in the yéere, with Syzygiæ Planetarum mutuæ.

In the ſixth Columne, the Changes, Fulls and Quarters, with the other Aſpects of the Moone.

In the ſeuenth and laſt, the age of the Moone.

Of

Of times prohibited from marriage this yeere 1630.

FIrſt, from the 29. of November the laſt yéere, to January 14. this yére.

Againe, from the 24. of January to the 5. of Aprill.

Alſo from the 2. of May to the 23. of May.

The foure Feaſts or Ember dayes this yeere, 1630.

ARe Febꝛuary 17. May 20. September 5. and December 15.

An Aduertiſement.

I Told you the laſt yére (obſeruing the generall diſpoſition of that yére, after ancient opinion,) it might be doubted, that an alteration of ſome things would happen amongſt vs

shortly after. Likely this present yeere a scarcity of corne or dearth of victuall. Many sicknesses amongst the richer sort, and young children. The death of Cattell, or such other cares and troubles. Now we must withall understand, that the beginnings of sorrowes, more and greater remaine for vs, but if we doe speedily repent vs of our sinnes. And wee ought wisely to consider the great mercifulnesse of God that forewarned vs, and would not strike before he speake: but on the contrary, if it shall please God for this time, (vpon the repentance happly of some) to avert those his iudgements from all: then is his mercy and goodnesse so much the more toward vs; which we ought humbly to acknowledge, and confesse with all possible thankefulnesse; so hee will soone put downe our enemies, and turne his hand against our aduersaries. Hee will crowne the yeere with his goodnesse. The folds shall bee full of sheepe, the Vallies also shall stand so thicke with corne, that they shall laugh and sing.

Of

Of the foure Quarters of this yeere 1630.

And first of Winter.

☉ in ♑ ♒ ♓.

THe Hyemall Solsticiall or Winter Quarter beginneth, when the Sun entreth into the first minute of the imaginary signe Capricornus, which came to passe the last yeare the 11. day of December, which was our shortest day and longest night.

Of the Spring.

☉ in ♈ ♉ ♊.

THe Vernall or Spring Quarter beginneth, when the Sunne entreth into the Equinoctiall signe Aries, which happeneth this yeere the 10. of March, making the day equall with the night.

Of the Summer.

☉ in ♋, ♌, ♍.

The Eſtiuall Solſticiall or Summer Quarter beginneth the 11. of June, which day the Sunne entreth into the imaginary ſigne Cancer, and maketh his greateſt Notherne declination, and then is our longeſt day and our ſhorteſt night.

Of Autumne.

☉ in ♎, ♏, ♐.

The Autumnall or Haruеſt Quarter beginneth when the Sunne entreth into the firſt minute of the ſecond Equinoctiall ſigne Libra, which makes the nights and dayes equall, which happeneth this preſent time the 12. of September.

The

The Æquinoctiall, ſo called, becauſe it maketh the day and night of equall length throughout the earth, happeneth twice in the yeere, as is aforeſaid: that is to ſay, the firſt in March, a day or two before Gregories day, and the other in September, three or foure dayes before Lamberts day, whereof ariſeth this old Verſe,

Lambert Gregori nox eſt æquata diei.

Of the Eclipſes hapning this preſent yeere. 1630.

There will this yeere be preſented to the view of the Inhabitants of the earth foure Eclipſes of the two great Luminaries or lights of heauen, two of the Sun, and Moone, whereof the firſt of the Sunne, and the latter of the Moone, ſhall be viſible in our Horizon, and the other two ſhall be ſeene in other Countries.

The Eclipſe of the Sunne viſible in our Horizon, happeneth the third of May at fiue of the clocke, and 20. minutes in the afternoone,

and

and will bee eclipsed 9. digits 7. minutes.

The Eclipse of the Moone visible in our Horizon, happeneth the 9. of November at 10. of the clocke and 20. minutes in the afternoone, and will be eclipsed digits 9. 27. minutes.

Of the sickenesses and other euils of this yeere.

The sicknesses, most likely to afflict mens bodies this yeere, (as farre as I can coniecture,) will not be very strange or extraordinary; but such for the most part, as are vsuall and common in other yeeres; which by Gods grace, and good meanes vsed, may be easily preuented, or in due time cured: but there are diuers other more dangerous euils and distemperatures, too common euery where, which by long running without any wholesome remedy applyed, or carefull preuention vsed, are so deeply seated in many a one, that they will hardly euer bee removed during the life of the parties. These are Gluttony, Drunkennesse, Tabacconizing, Idlenesse, Fornication, Cursed speaking, Lying, Backbiting, Couetousnesse, Vsury, Extortion, Bribery,

Bribery, Hypocriſie, Idolatry, Sectes, Hereſies, and the like.

Theſe are deadly, ore-ſpreading euils, no leſſe curable, than dangerous. And to bee plaine, there is ſo little ſence or feeling in moſt men, of their owne deſperate eſtate through ſinne, that they care not for any reſtorative to bring them to amendment of their liues, but rather doe oppoſe themſelues to vertues, and become enemies to goodneſſe, and to them that would them good.

I pray God in mercy to amend all that is amiſſe.

That God may be found out by his Creatures.

I Haue in my former bookes diſcourſed vnto you of the World, what it is, namely, Heauen and Earth, and all things therein contained, how it was created at the firſt, namely, by God, by his only Word, of nothing: and how it is deuided, viz. into two parts or regions, Aetherea all, and Elementary.

The

The Elementary part containeth the foure Elements, Earth, Water, and Fire.

The Aetherall part containeth the eleuen Heauens or Spheares, (that is to say) the seuen Planets, viz. The Sunne, Moone, &c. and their Spheares. The starry Firmament, the chrystaline Heauen: the first Mouer, and the Imperiall Heauen. Of this heretofore at large.

Now I would that men should not Heathenishly giue credit to the Aspects and motions of the Starres and Planets, for the good or bad successe of their affaires, and actions: but rather in those mighty Creatures, to behold the Almightinesse of their Creator; at whose disposition standeth the euent of euery particular action, and without whose prouidence, not a Sparrow lighteth vpon the ground.

The wonderfull frame of the World doth euen speake vnto vs, and tell vs, that there is a God: the Creatures made not themselues: The Heauens are as great Capitall letters, by which we may see the power of God, if we will consider his workes. The Eternall power and God-head (saith Paul) are seene in the Creation of the World, Ro. 1.20. The Heauens (saith Dauid, meaning the exquisite workemanship of them) declare the glory of

God,

God, and the Firmament sheweth his handy worke, Psalm. xix. The continuall succession of day and night, and the Sunne which goeth forth from the vttermost part of the earth, and runneth about vnto the end of it againe, (nothing hid from the heat thereof) may suffice to teach the most barbarous Nations the power of God.

The dumbe creatures set forth Gods glory: they performe obedience to their Creator, they neuer cease to vse their dutie and office set: and yet, man (alas) for whom all those creatures were made, is euer starting aside from the Lord his Maker; apt to all vanitie, either careleſſe for, or vtterly ignorant of his duety towards God.

Elections for Husbandry.

VVHen you meane to graft, plant, remoue, lop, top, proine and slit the barkes of trees, and to set or sowe kernels, nuts, and stones, make choise of a faire warme day,) and when the wiud is not East, North or Northeast.

Set Apple kernels in March, with the end that

that is next the rote downewards, at the least one hands-breadth betweene euery kernell.

Lop, top, and proine your fruit Trées in January, in the waine of the Moone, and pare them ouer in March, so shall the barke couer his stocke the soner.

Slit the barke of all Trées that are barke-bound, in February or March, the Moone increasing.

Torecouer a Trée that is almost dead; first vncouer the rote of the Trée, let it be bare, and take the ayre a few dayes, then take two quartes of Ore blood, or Horse blood, temper it with Pigeons dung, till it be as a soft paste, then apply it to the rotes, fasting the same about them.

Gather your fruits at the full Moone.

Sheare your Sheepe in the increase of the Moone.

Soyle your land in the decrease of the Moone.

Lib or geld Cattell, the Moone increasing, in Aries, Sagitarius, or Capricornus.

Soot, and the ashes of Ferne strewne in pasture ground will inrich the ground.

A Table

A Table ſhewing the time of the Moones comming South, and alſo the time of the Tide or full Sea in diuers principall Hauens.

The Moones age.	Her comming to South.	Principall Hauens.	H.	M.
1 16	12 48	Quinb. Southamp. Portſm.	0	0

5 30	12 0	Bullen, Douer Harw. Yar.	10	30
0 0	0 0	Callice, Winchelſey, Rye.	11	15

TO know the time of the Moones comming to the South, firſt, finde by the ſeuenth Columne of this Almanacke, her age, (that

(that is, how many dayes is past from the time of her change.) Her age being found, then also finde the same in the first or second Columne of the precedent Table: answering to which, in the third or fourth Columnes is the houre and minute of her comming to South.

Note, that all her increase she commeth to the South, in the afternoone, and all her decrease in the forenoone.

To know the time of the Tide or full Sea in any of the Hauens in the Table aforesaid, adde to the time of the Mones comming South, the houre and minute adioyning to the same houres, and you haue your desire.

A Rule to know the houre and minute of Sun-setting, length of the Artificiall day and night.

First finde the houre and minute of Sun-rising in the fifth column of this Almanack, and looke how many minutes he riseth before nine, eight, seuen, sixe, fiue, or foure, so ma-

ny

ny minutes he setteth after three, foure, fiue, sixe, seuen or eight.

The houre and minute of Sun-rising being doubled, is the length of the artificiall night, which substracted from 24. houres, the length of a naturall day, the remainder is the length of the artificiall day.

A Rule to finde the vnequall houres, otherwise called the Planetary houres.

First finde by the Rule afore-going, the length of the artificiall day, which reduce into minutes, the totall whereof diuided by 12. the quotient, together with the remainder (if any shall happen) is the number of minutes that each Planetary houre shall containe.

The like is to be done to know the vnequall or Planetary houre of the night, for hauing found the length of the night, reduce it into minutes, the totall deuide by 12. the quotient with the remainder (if any shall be) is the length of the Planetary houre for that night.

Now, to finde any time of the day what Planetary houre it is first, finde by the fifth Columne of this Almanacke, the houre and minute the Sunne doth rise vpon the day proposed, and also the true houre of the day at the time proposed, then finde how many houres and minutes the said proposed time is after Sun-rising, the number of which houres multiply by 60. and to the product adde the odde minutes: then the totall deuided by the number of minutes that a Planet raigneth, the quotient is the number of the Planetary houre. And to know what Planet raigneth that houre: Consider first, what Planet the day is called by, then giue to that Planet the first houre, and to the next the second houre, vntill you come to the houre proposed; and that Planet which falleth to that houre, is the Planet that ruleth at that time. But for more ease behold the ensuing Table, where it plainely appeareth what Planet raigneth in euery houre of the day, or night Artificiall.

The description and vse of the precedent Table.

IN the first Columne of this Table on the left hand, are set downe the seuen dayes of the weeke, against euery which day the Planets are placed towards the right hand, and in the first row of this Table which is the head or front thereof, are placed the houres of the day written in Arithmeticall figures, and in the next row are the houres of the night written likewise in figures. Whensoeuer you would know what houre of the day or night,

any Planet raigneth, seke out the houre of the day or night, & frō that houre descend with your finger to the cōmon angle, standing against the day which you seke, & that will shew you what Planet raigneth. As for example, if you would know for Wednesday at 8. of the clo. of the day what Planet raigneth, find out the number of 8. in the front written in arithmeticall figure, come straight downe from thence with your finger to the common Angle standing right against Wednesday, & you shall finde that Mercurie reigneth. But you must note that the 8. houre of the day is the 8. Planetary houre from Sun rising. And in like manner you must doe for the night.

Here followeth a Table which plainely sheweth the placing and magnitude of the seuen Planets, and what proportion each of their Diameters beareth to the earths Diameter, and how of these Planets Saturne, Iupiter, Mars, Sol, containes the earth in greatnes, and how many times the earth containeth Venus, Mercurie, and Luna, with the thinckenesse of their seuerall Spheares, and their seuerall distance from the earth in their meane motion: according to the opinion of the most ancient Astronomers.

The

	Mouing vnder the	Spheare	is lesse then the earth.	containes the earth	Times,	The diameter being as			His Spheare containes in thickenesse.	English miles.	And is distant from the earth in his mean motiõ	English miles.
Saturne	8			95		9	2		$19604454\frac{6}{11}$		9073000	
Iupiter	7			91		32	7		$1899654\frac{6}{11}$		3431400	
Mars	6			2		6	6		26398800		1500700	
Sol	5			166		11	2		$343996\frac{4}{11}$		989000	
Venus	4			36		5	10		$3274494\frac{6}{11}$		*Ve & Mer. in their mean motion be as the Sun.*	
Mercury	3			3143		3	8		$253372\frac{2}{3}$			
Luna	2			39		5	17		$105222\frac{2}{33}$		48760	

By this Table it appeareth, that the Sun moueth vnder the 5. Spheare, containes the earth 166. times, their Diameters being as a 11. to 2. His Spheares containes in thickenesse $343996\frac{4}{11}$. English miles, and is distant from the earth in his meane motion 989000. English miles.

Also it appeareth that the Moone moueth vnder the 2. Spheare, and is lesse then the earth 39. times, their Diameters being as 5. to 17. Her Spheare conteines in thickenesse $105222\frac{2}{33}$ English miles, and distant from the earth 48760. miles. The like of the other Planets.

The seuen Ages of Mans life.

Mans life may be deuided (according to the diuision of the World) into seuen Ages: ouer euery which Age, one or other of the Planets more specially is said to raigne.

1

The first Age is called Infancy, viz. from ones birth to seuen yeares after: Ouer which the Moone raigneth, being of a cold and moist nature.

2

The second is called Childhood: that is, from seuen yeares of age to foureteene: Ouer which Mercury raigneth, which is of a variable nature, making children inconstant, yet inclinable to learne.

3

The third Age is Youth, at foureteene to two and twenty: ouer which Venus is predominate, temperately cold and moist, making one to be amorous and lustfull, apt to pleasure.

The

4

The fourth Age is at two and twenty to foure and thirty yæres: In which station one is called a Yong man: Ouer this Sol raigneth hot and somewhat dry, Cholericke, &c.

5

The fifth Age is called Mans age, proceeding where the other ended, till 50. yeeres of Age: In this season Mars is gouernour: extreme hot and dry. Men begin to be couetous, charlish, cholericke, &c.

6

The sixth Age is at fifty, (the Age of grauity) And so to sixty two yeeres: Ouer this Iupiter ruleth: Hot and moist, inclining to iustice and moderation, and to be wise and carefull.

7

The seuenth, Age is at threescore & two yæres, called Old Age, till threescore and tenne, or fourescore yæres of age, if a man can liue so long: yet then is his strength but labour and sorrow, saith Dauid. Ouer this season Saturne raigneth, making a man to become froward, melancholy, cold and earthly, &c.

God saue the King; All faithfull Subiects pray,
Long liue and raigne *K. Charles*, let's euer say.

FINIS.
